The Valvoline letters are embossed and backed with translucent red vinyl and back-sprayed white.

THERMAL FORMED EMBOSSED SIGNS

Bring more visual excitement to your next sign face with Jones Sign thermal forming. Panned and embossed thermal formed faces offer good value for sign faces where a more dimensional look is desired. Give your graphics a bolder look that will outlast a typical sign face. Adhering translucent vinyls, digital prints and back painting results in an even high gloss finish. These faces have been a popular choice for decades.

- We use solar grade polycarbonate to manufacture the faces.
- Thermal forming increases overall strength and durability over flex or flat acrylic faces.
- Thermal forming improves light distribution in narrow sign cabinets.
- Offers consistency of color day or night.
